

Regime-bounded study design

a Transport subset used for the main low-shot claim

Representative test crops for the four-class subset used in the manuscript.

b Urban subset used to test cross-subset transfer

Representative test crops for the four-class subset used in the manuscript.

c Matched-comparison pipeline

d Boundary-analysis map

Condition	Subset	Backbone	Shot	Seeds	Narrative role
Main window	transport_logistics4	Small CNN	16	7	Positive low-shot test.
Shot boundary	transport_logistics4	Small CNN	32 / 64	7	More labels, same subset.
Backbone boundary	transport_logistics4	ResNet18	16	7	Stronger transfer features.
Subset boundary	urban_structural4	Small CNN	16	7	Different subset composition.

The figure isolates where any gain arises: same task, same subset, same backbone family, and a direct quantum-vs-classical head comparison before boundary stress tests. The paper's main claim is visible here as a test ladder rather than a single isolated win.
